PROFILE

Final-year BSc (Hons) Computer Science undergraduate at the University of Jaffna. I enjoy building software and have worked on projects covering web development, machine learning, and blockchain during my studies. I like solving practical problems and am always looking to learn and improve my skills.

EDUCATION

BSc (Hons) Computer Science · University of Jaffna, Sri Lanka · 2021 – 2028 (Expected) · GPA: 3.21 / 4.00

G.C.E. Advanced Level (A/L) · Narammala Mayurapada Central College

Combined Mathematics (A) · Physics (B) · Chemistry (C)

PROJECTS

Blockchain-Based Agricultural Supply Chain — Final Year Research Project

Hyperledger Fabric · Chaincode · Off-chain Storage · Cryptographic Hashing | 2024 – Present

- Built a permissioned Hyperledger Fabric network to track agricultural products from farm to consumer; wrote chaincode to record product data, certifications, and ownership transfers on the ledger.
- Used off-chain storage with cryptographic hashes linked to the ledger to keep large files out of the chain without losing tamper-evidence.
- The system improved transparency between supply chain parties and reduced the need for manual verification.

AutoSANP: Policy-Driven Automated Network Administration — Final Year Networking Project

Ansible · Python · OpenSSH · Ubuntu Server · Bash | 2024 – Present

- Built a platform to automate server setup and monitoring across Ubuntu machines using Ansible playbooks for firewall (UFW), SSH hardening, package updates, and service management.
- Wrote Python scripts to detect anomalies in CPU, memory, and service states, and automatically run recovery steps when something fails.
- All remote access handled via OpenSSH key-based auth — no plaintext credentials used anywhere.

Focus AI System — AI-Powered Productivity Tracker

Python · React · Node.js · ML Classification · NLP | 2024

- A Python background process tracks active window titles and app usage; a trained ML classification model labels each session as productive or distracted based on app type and usage patterns.
- Node.js REST API handles data collection and session history; React frontend shows live charts, focus timelines, and daily stats.
- Added a prediction module that looks at past patterns to suggest the best times to focus and adjust task scheduling.

SmartLib — University Library Management System

Java · Spring Boot · React · MySQL · REST API | 2023

- Full-stack library system where students can search, reserve, and borrow books; librarians can manage inventory, track due dates, and send overdue notifications.
- Spring Boot REST API with JWT authentication and role-based access for students, librarians, and admins; React frontend for real-time book availability and borrowing history.
- MySQL database with normalised schema for books, members, loans, and reservations; includes fine calculation logic and automated email notifications for overdue returns.

MagmaApp — Generator Service Company System — 3rd Year Group Project

Laravel · React · MySQL · REST API · RBAC | 2023

- Replaced paper-based workflows with a digital system for job card creation, service quotations, invoices, and real-time job tracking.
- Laravel REST API backend with a MySQL schema covering customers, equipment, jobs, and billing; React frontend for admin and field staff.
- Role-based access control so managers, technicians, and accountants each see only what they need.

Attendance Management System — 2nd Year Group Project

Laravel · PHP · Fingerprint Biometrics · MySQL | 2022

- Biometric attendance system using fingerprint scanners to verify employees, removing proxy attendance completely.
- Laravel/PHP backend handles fingerprint storage, employee registration, shift scheduling, and report generation; HR dashboard covers daily logs, monthly reports, and leave management.

Blockchain Tic-Tac-Toe — On-Chain Game Simulation

Solidity · Express.js · Three.js · Smart Contracts | 2023 – 2024

- Tic-Tac-Toe game where all logic — move validation, turn order, win/draw detection — runs on Solidity smart contracts in a local blockchain simulation.
- Express.js backend connects to the simulated chain; Three.js 3D frontend for real-time gameplay.

Social Media UI · PySimulator — Bad Cookie Detection

React · Vercel | Python · MS Azure Cognitive Services · Computer Vision | 2022 – 2023

- Social Media UI: Facebook-inspired React app with login, news feed, post creation, and profile pages — deployed on Vercel.
- PySimulator: Python-based defect detection system for identifying bad cookies using a computer vision model trained on labelled images, integrated with Microsoft Azure Cognitive Services.

TECHNICAL SKILLS

Languages	Python, JavaScript, PHP, Solidity, Bash
Frontend	React.js, Three.js, HTML5, CSS3, Tailwind CSS
Backend	Node.js, Express.js, Laravel, REST APIs
Blockchain	Hyperledger Fabric, Solidity, Chaincode, Smart Contracts, Web3.js
ML / AI	ML Classification, TensorFlow, Scikit-learn, NLP, MS Azure AI
DevOps / Infra	Ansible, OpenSSH, Ubuntu Server, Linux Administration
Databases	MySQL, MongoDB, Off-chain Storage Patterns
Tools	Git, GitHub, VS Code, Postman, Vercel

EXTRACURRICULAR & INTERESTS

Sports & Leadership

- University Carrom Team — inter-university competitions
- School Cricket Team — competitive player
- School Cadet Corps — leadership & community service
- Competitive Chess

Interests

- Open Source Contribution & Blockchain Research
- Movies & TV Series
- Reading — Technology & Fiction
